Native Plants for Maryland

INTRODUCTION

This guide is intended to help in the selection of native plants for habitat restoration, critical area buffer management and natural landscaping projects. All of these plants are native to Maryland. Each section lists plants in alphabetical order by their Latin names. Common names are included and are cross-referenced in the index. Growth conditions and plant characteristics are also included.

WHAT ARE NATIVE PLANTS?

A native plant is a species that originates or occurs naturally in a particular region. As our local habitat is disturbed by development, non-native and invasive plants change the character of our landscapes. Although many naturalized but introduced plants occur in most regions, the native plants listed are species that existed in Maryland when the European settlers arrived, or they are cultivars of these species. For any plant to thrive, it must be planted under the proper growing condition for that species (ie correct moisture, light, soil). Native plants create beautiful landscapes possessing the charm and character unique to our region's natural history.

WHY USE NATIVE PLANTS?

Conserving and reintroducing our native plants can help us recapture our regional character. These plants:

- Are naturally adapted to the local environment
- Are often more disease resistant than non-natives
- Serve our human desire for attractive landscaping
- Provide food and shelter for wildlife

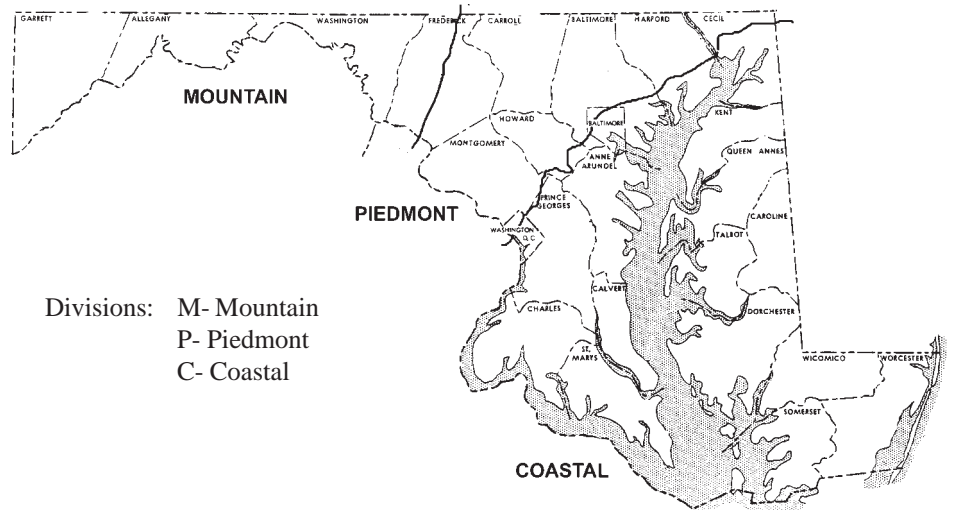

Native plants protect our natural resources by requiring:

- Fewer chemicals
- Less water
- Lower maintenance

WHAT ARE GROWTH CONDITIONS FOR NATIVE PLANTS?

Maryland is host to a wide variety of native plants. This is due to the diversity of geographical and climatic conditions. The state is divided into three physiographic regions coastal, piedmont and mountain. You may use the map below to determine your region.

State of Maryland Physiographic Regions

Light and Moisture Key for this booklet

LIGHT

- Full sun: The site is in direct sunlight for at least six hours a day during the growing season
- ◐ Partial sun: The site receives approximately 3 to 6 hours of direct sunlight
- Shade: The site receives less than 3 hours of direct sunlight.

MOISTURE

- ◆ Wet: Areas where the soil is saturated for much of the growing season
- ∴ Moist: Areas where the soil is damp and occasionally saturated
- ▲ Dry: Areas in full sun or in a windy location. Water does not remain after a rain.

WHAT ARE SOIL CONDITIONS FOR NATIVE PLANTS?

Many of the native plants listed will grow in the wide range of soil types that exist in Maryland. However, if your site has one of the following conditions, it would be best to get advice on soil preparation from a local nursery or the University of Maryland's Home and Garden Information Center (1-800-342-2507):

- Very sandy
- Heavy clay
- Compacted soil
- Soil pH below 5.5 or above 6.8.

WHERE TO FIND NATIVE PLANTS?

Most nurseries carry some native plants. Because of the demand for native species, several local nurseries have increased their selection. A partial list of known native plant sources is available with this guide.

Please do not remove native plants from the wild. It can alter the natural habitat and deplete native populations. Most wild-collected plants do not survive transplanting. Growth conditions for some natural areas are difficult to reproduce in the home landscape. For these reasons, make sure that the native plants you buy are nursery-grown.

WHAT ARE INVASIVE NON-NATIVE PLANTS?

Certain non-native ornamentals have been taking over natural areas due to their aggressive characteristics. In the next column is a list of plants that should be carefully controlled or even avoided in your landscape.

The beauty of native plants and their natural resistance to insect and disease makes them an indispensable asset to your garden. Native plants help to create landscapes that possess the charm and character of our local natural history. Plant a wide variety of these species in your landscape to attract a diversity of beneficial insects. Traditional landscapes can be amended to include native species. By using these beautiful plants, you will be contributing to the conservation of our nation's species.

GLOSSARY

- Annual** Plant that completes its life cycle in one growing season
- Bog** An acid water-saturated area with soil that has a large amount of peat and other organic matter
- Brackish** Slightly salty
- Crown** (1) growing point of a plant from which new shoots arise; (2) uppermost part of a tree or shrub
- Evergreen** Plant specimen that retains leaves for more than one growing season. As old leaves or needles fall, new ones replace them so tree is never without foliage
- Hardy** The ability of a plant to survive the minimum average winter temperatures in our region; winter-hardy or cold-hardy
- Herbaceous** Plant that dies to the ground at the end of the growing season
- Hybridize** Cross-breeding of two distinct species
- Invasive** Vigorous plant growth that rapidly overwhelms other species
- Marsh** Lowland flooded in wet weather, usually watery at all times
- Naturalized** A plant of foreign origin which establishes itself in its new habitat
- Ornamental** A plant used as a decorative piece in the landscape
- Perennial** Plant that lives for more than two growing seasons; usually applies to non-woody plants
- Shrub** A deciduous or evergreen perennial with multiple woody stems or branches, generally bearing branches from or near its base
- Tree** Woody perennial with a crown of branches developing from the top of a usually single stem or trunk
- Well-drained** Areas where rain water drains fairly quickly and puddles do not remain long after hard rains
