

Let's go on a

Pollinator Scavenger Hunt!

What are **Pollinators**?

Pollinators are important animals that move pollen from one flower to another to help plants produce seeds and fruit for us to eat or grow more plants. Most pollinators are insects, such as bees, butterflies, wasps, flies, beetles and ants. Some birds, such as hummingbirds, and even some bats help pollinate plants. People depend on the help of pollinators on our farms and in our gardens to have fruit to eat and seeds to plant.

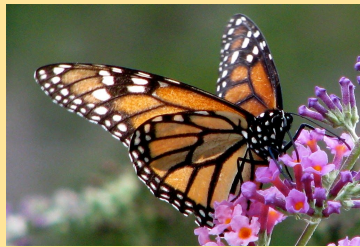

Check off each pollinator you find in your backyard.

Have Fun!
