GROW IT · EAT IT

A MASTER GARDENER PROGRAM

University programs, activities, and facilities are available to all without regard to race, color, sex, gender identity or expression, sexual orientation, marital status, age, national origin, political affiliation, physical or mental disability, religion, protected veteran status, genetic information, personal appearance, or any other legally protected class.

AND JUSTICE FOR ALL

In accordance with Federal law and U.S. Department of Agriculture (USDA) civil rights regulations and policies, this institution is prohibited from discriminating on the basis of race, color, national origin, sex, age, disability, and reprisal or retaliation for prior civil rights activity. (Not all prohibited bases apply to all programs.)

Program information may be made available in languages other than English. Persons with disabilities who require alternative means of communication for program information (e.g., Braille, large print, audiotape, and American Sign Language) should contact the responsible State or local Agency that administers the program or USDA's TARGET Center at (202) 720-2600 (voice and TTY) or contact USDA through the Federal Relay Service at (800) 877-8339.

To file a program discrimination complaint, a complainant should complete a Form AD-3027, USDA Program Discrimination Complaint Form, which can be obtained online, at www.usda.gov/sites/default/files/documents/usda-program-discrimination-complaint-form.pdf, from any USDA office, by calling (866) 632-9992, or by writing a letter addressed to USDA. The letter must contain the complainant's name, address, telephone number, and a written description of the alleged discriminatory action in sufficient detail to inform the Assistant Secretary for Civil Rights (ASCR) about the nature and date of an alleged civil rights violation. The completed AD-3027 form or letter must be submitted to USDA by:

mail:
U.S. Department of Agriculture
Office of the Assistant Secretary for Civil Rights
1400 Independence Avenue, SW
Washington, D.C. 20250-9410; or

fax:
(833) 256-1665 or (202) 690-7442;

email:
program.intake@usda.gov.

This institution is an equal opportunity provider.

Conforme a la ley federal y las políticas y regulaciones de derechos civiles del Departamento de Agricultura de los Estados Unidos (USDA), esta institución tiene prohibido discriminar por motivos de raza, color, origen nacional, sexo, edad, discapacidad, venganza o represalia por actividades realizadas en el pasado relacionadas con los derechos civiles (no todos los principios de prohibición aplican a todos los programas).

La información del programa puede estar disponible en otros idiomas además del inglés. Las personas con discapacidades que requieran medios de comunicación alternativos para obtener información sobre el programa (por ejemplo, Braille, letra agrandada, grabación de audio y lenguaje de señas americano) deben comunicarse con la agencia estatal o local responsable que administra el programa o con el TARGET Center del USDA al (202) 720-2600 (voz y TTY) o comunicarse con el USDA a través del Servicio Federal de Transmisión de Información al (800) 877-8339.

Para presentar una queja por discriminación en el programa, el reclamante debe completar un formulario AD-3027, Formulario de queja por discriminación del programa del USDA, que se puede obtener en línea, en www.usda.gov/sites/default/files/documents/usda-program-discrimination-complaint-form.pdf, en cualquier oficina del USDA, llamando al (866) 632-9992, o escribiendo una carta dirigida al USDA. La carta debe contener el nombre, la dirección y el número de teléfono del reclamante, y una descripción escrita de la supuesta acción discriminatoria con suficiente detalle para informar al Subsecretario de Derechos Civiles (ASCR, por sus siglas en inglés) sobre la naturaleza y la fecha de la presunta violación de los derechos civiles. La carta o el formulario AD-3027 completado debe enviarse al USDA por medio de:

correo postal:
U.S. Department of Agriculture
Office of the Assistant Secretary for Civil Rights
1400 Independence Avenue, SW
Washington, D.C. 20250-9410; o

fax:
(833) 256-1665 o (202) 690-7442;

correo electrónico:
program.intake@usda.gov.

Esta institución ofrece igualdad de oportunidades.

University programs, activities, and facilities are available to all without regard to race, color, sex, gender identity or expression, sexual orientation, marital status, age, national origin, political affiliation, physical or mental disability, religion, protected veteran status, genetic information, personal appearance, or any other legally protected class.

Welcome

- The mission of the University of Maryland Extension Grow It Eat It (GIEI) Program is to promote backyard and community food production.
- Master Gardeners teach classes and workshops, develop demonstration gardens, and educate Marylanders on how to produce their own affordable and healthy food using sustainable gardening practices in their homes, communities, and school gardens.

<https://go.umd.edu/giei>

Tentative Agenda

- . 10:00 - 10:10 -- Introductions - Maryland's HGIC and Ask Extension Program
- . 10:10 - 10:30 -- General Problems of Vegetable Gardens
- . 10:30 -10:55 -- Common Problems of Tomatoes
- . 10:55 - 11:05 -- Questions
- . 11:05 - 11:15 -- **BREAK**
- . 11:15 - 11:30 - Other Vegetable Problems -Pests
- . 11:30 - 11:45 - Other Vegetable Problems -Diseases
- . 11:45 - 12:00 -- IPM and Resources
- . 12:00 - 12:30 - Plant Clinic - What's "bugging" You?

What are HGIC and Ask Extension?

The University of Maryland Extension Home and Garden Information Center (HGIC) includes:

- Gardening & IPM pages
- Maryland Grows blog (also [Extensión en Español](#))
- HGIC YouTube channel [UMDHGIC - YouTube](#)
- HGIC Quarterly Newsletter - Subscribe!
- Social Media pages
- Monthly Tips [Monthly Gardening Tips | University of Maryland Extension \(umd.edu\)](#)
- Ask Extension- answers to garden and pest questions

HGIC Ask Extension -- How Does It Work?

Maryland residents can submit questions and photos and receive email answers.

Follow "tips for submitting photos" link on Ask Extension

Provide context for your question -- information beyond "what is this?" and your photos

Questions can be private, or they can become a part of the Ask Extension Knowledgebase, where you can search answered questions

General Considerations for Vegetable Gardens

- Strong Plants are less susceptible to diseases and pests! Create a Healthy Plant Environment.
- Climate - Plant crops in the right season - cool or warm
- Location - Make sure your veggie plants have the right amount of sunlight
- Spacing - allow for proper spacing
- Water - water adequately and correctly (morning and evening are best; avoid overhead watering)

Soil - Provide good soil with the right nutrients and structure. Get a soil test and follow recommendations.

General Garden Considerations, cont'd

Frost damage on tomato plant

Symptoms affecting more than one plant species may indicate cultural and environmental problems (abiotic-not related to insects or diseases)

The majority of plant issues are not caused by diseases or insects. Problems may be caused by non-living (or abiotic) factors:

- Excessive cold or heat
- Nutrient deficiencies
- Herbicide damage
- Drought or excess moisture
- Wildlife or pets

Herbicide damage on tomato

Phosphorus deficiency on tomato

General Garden Considerations, cont'd

Excessive Heat -- Sustained hot temperatures (more than 85° F in the day and 70° F at night) can cause many vegetable plant problems:

- Flowers drop before pollination
- Reduced bee activity results in deformed fruits on pollinator-dependent crops
- Leaves curl to retain water
- Green tomatoes don't ripen
- Squash produces more male flowers

Leaves curl on plants to retain water. This usually won't harm to plant

What to do?

- Check moisture levels often
- Consider shade cloth over crops
- Be patient - cooler weather will salve most of these problems

Tomato Blossoms Dropping

Poor fruit pollination
Photo University of MN Extension

Tomato Plants covered with 30% Shade cloth

General Garden solutions

- Prevent and manage pests using biological, physical, and cultural methods
 - Select resistant varieties
 - Monitor plants regularly, including leaf undersides, to catch pests and diseases early
 - Signs versus symptoms (e.g., eggs vs. chewed leaves)
 - Remove nearby weeds, mulch, etc. that harbor garden pests
 - Hand-pick pests if possible
 - Prune out diseased portions of plant and dispose of these properly (generally do not compost)

General Garden solutions - Barriers

Consider barriers such as floating row over, insect netting, and fencing to exclude pests

- **Insect netting**- woven polypropylene
- Protects crops without temperature increase
- Openings should be <1 mm to exclude thrips, aphids, and small flies

Row Cover - Spun-bonded polyester material
Secured to ground; floats on crop or over a frame.
Excludes insect pests and wildlife
Increases crop growth in spring and fall

Biological Control

The enemy of my enemy is my friend - Ancient proverb

- Predators eat pests; Parasitoids lay their eggs on or in pests

Plant a variety of annuals and perennials around vegetable beds to provide nectar and pollen for natural enemies and pollinators

Tachinid fly

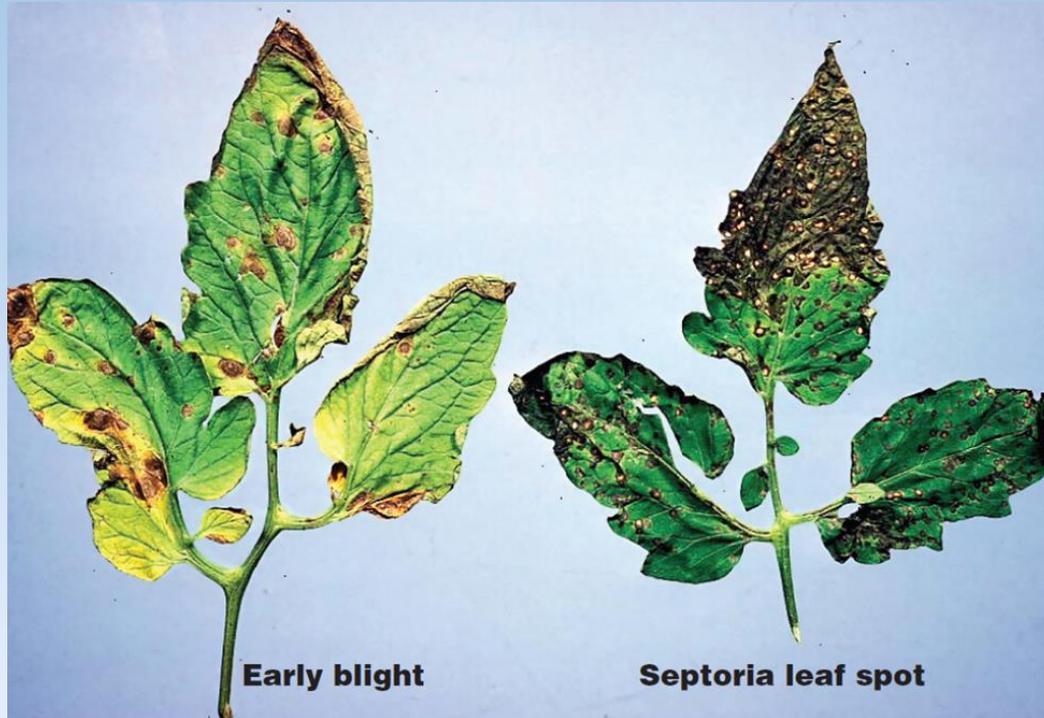

Avoid broad-spectrum pesticides that target a wide range of insects. They can kill beneficial bugs.

Two-spotted stinkbug spearing a Colorado potato beetle larva

Common Problems of Tomatoes - foliar

Early Blight and Septoria Leaf Spot

Early Blight
and Septoria
Leaf Spot
often co-
occur and are
generally
managed in
the same way.

Photo credit University of Wisconsin Cooperative Extension

Common Problems of Tomatoes, Foliar

• Septoria Leaf Spot

• **Symptoms:** small, round gray spots with dark margins develop on the lower leaves, usually when the first fruits begin to form.

• Septoria leaf spot is caused by a fungus, *Septoria lycopersici*. The pathogen is favored by wet weather.

• Fungal lesions gradually enlarge, coalesce, and cause leaves to turn yellow and die.

Tiny black pycnidia (fungal fruiting bodies) can be seen in the lesions.

Common Problems of Tomatoes, Foliar

- Early Blight (Alternaria Leaf Spot)

Early blight begins as small brown spots on older leaves that quickly enlarge and coalesce. A yellow halo usually surrounds the lesions.

- The disease can also move to stems and fruits and produce dark lesions. When leaves die, fruits become more vulnerable to sunscald. Infected, dead leaves may stick to fruits.

A severe early blight infection

- The disease can spread during wet or dry weather but is favored by rainfall and heavy dews.

- The disease spores are wind-blown, allowing the disease to spread through a garden or neighborhood.

Common Problems of Tomatoes, Foliar

Management of Septoria Leaf Spot and Early Blight

Try planting resistant varieties, and space plants at least 2 ft. apart

Remove lower leaf branches when plants are established

Water at plant base -- avoid overhead watering

Spray with fixed copper fungicide; other organic sprays have not proven effective. Spray early in the season as soon as first symptoms are seen even preventatively where it is chronic.

Diseased plant parts can be only shredded and composted if "hot composting" techniques are used. Otherwise, bag them and put in the trash.

Tomato Problems, PESTS

- Hornworms

Tobacco Hornworm (red or pink horn) and Tomato hornworm (black horn) behave the same.

The Tobacco hornworm is actually more common on tomatoes in the southeast US.

Host Plants - Solanaceous plants: particularly tomato; less commonly on eggplant, pepper, potato.

Larvae feed voraciously on leaves and sometimes fruit.

Tobacco hornworm

Pepper plant defoliated by a hornworm, Note the characteristic dark frass (circled) - a sign of the pest.

Tomato Problems, PESTS

- Hornworms - monitoring and control

Green larval color is an effective camouflage, making the caterpillars difficult to detect.

Feeding ordinarily begins at the TOP of the plant. Hornworms usually consume entire leaves, rather than chewing holes in them, and can rapidly defoliate plants.

Mostly interior leaves are eaten (vs. deer that browse on one side of plant).

Dark, BB-sized, cube shape droppings on leaf surfaces indicate late instar caterpillars feeding above.

Shining a UV light on plants at night can help you find hornworms

Tomato Problems, PESTS

•Hornworms rarely warrant the use of an insecticide, but BT Bacillus thuringiensis can be effective. Look for the type that targets caterpillars that feed on vegetables, trees, and shrubs,

HORNWORM CONTROL

Spraying water agitates hornworms and makes them easier to spot.

- Handpick caterpillars and drop them into a container of soapy water.
- Large hornworms are often parasitized by wasps. The cocoons of Braconid wasps look like grains of rice attached to the hornworm's back. Do not kill parasitized hornworms!
- Let the wasps complete their lifecycle so they can multiply. A parasitized hornworm stops eating and eventually dies.

Tomato Problems, Pests

- Stinkbugs - damage

Many types of Stinkbugs, the ones most common on tomato are Brown Stinkbug, Green stinkbug, and Brown Marmorated Stinkbug

Adults: 5/8" shield-shaped bugs

Piercing and sucking create superficial spots (white on young fruit or yellow on mature fruit) known as "cloudy spot" on tomatoes and other fruits

Stinkbug damage on tomato

Cloudy spots in the fruit can be cut out. This does not affect eating quality

Brown Marmorated stinkbug

Green stinkbug

BMSB eggs and nymphs

Tomato Problems, Pests

• Predatory Stinkbugs - the Good Guys

- Unlike other stinkbugs, predatory stinkbugs are a gardener's friend, feeding on more than 100 species of insect pests

- Predatory stink bugs tend to have a shorter, stouter beak than the long, thin beak of plant-feeding stink bugs

- **Important species in Maryland:** Spined soldier bug, two-spotted stink bug

Mitigate Pest and disease damage by picking tomatoes early and ripening indoors

Picked Husky Red tomato as color began to show July 7th. Placed near sunny window

After two days
July 9th

After five days
July 12th

After eight days
July 15th - fully ripe

Volunteer tasters on July 15th agreed that it tasted the same as Husky Red tomato that was vine ripened

QUESTIONS?

BREAK

COMMON PROBLEMS OF OTHER VEGETABLES

Other Vegetable Problems - Pests

Colorado Potato Beetle - Damage

HOST PLANTS - Eggplant is a favorite. Also eats potato, pepper, tomato, and other solanaceous plants

Adults and larvae chew holes in leaves, terminals, and fruit. Most damaging when plants are young.

After defoliation is complete, stems and even potato tubers may be gnawed

- Watch for clusters of small orange eggs laid on leaf undersides. Feeding damage will be quickly evident.
- Slow-moving adults and congregating larvae are easily spotted.

(Photo credit: J. Obermeyer Purdue University Extension)

Other Vegetable Problems - Pests

Colorado Potato Beetle - Management

Locate and crush eggs, larvae, and adults often and early in season to effectively prevent later generations. Slow-moving adults do not disperse far.

Use floating row covers or insect netting to exclude the beetles.

Spinosad and neem products are effective organic insecticides for controlling larval stages. Diatomaceous earth can also help.

Other Vegetable Problems - Pests

Squash Bugs- Damage

Adult squash bug

Host Plants - All cucurbits, especially squash and pumpkin. Also cantaloupe, cucumber, gourds, watermelon.

Squash bug feeding occurs primarily on leaves and stems but may also occur on fruit.

Adults and nymphs suck leaf sap leaving numerous small white dots, known as stippling

Large numbers of squash bugs will cause leaves to yellow and die

Stippling on leaves

Squash bug eggs and newly hatched nymph

Other Vegetable Problems - Pests

Squash Bugs - Management

Duct tape can be used to remove eggs and small nymphs. Repeat frequently to stay ahead of hatching.

- Cover plants to prevent egg-laying - must be removed for pollination in most cultivars
- Egg clusters are difficult to hand crush, so tear out that portion of leaf and destroy. Nymphs can be hand-crushed or drowned in soapy water.
- Neem, horticultural oil, and insecticidal soap are effective when sprayed directly on nymphs. Adults are very difficult to kill with the insecticides available to home gardeners.
- Trap adults and nymphs by placing boards near host plants under which they will hide. Lift boards and destroy bugs in the morning

Other Vegetable Problems - Pests

Squash Vine Borer

Host Plants - Summer and winter squash and pumpkin. Very rarely in cucumber, gourd, and melon

Tunneling larvae push greenish white sawdust-like frass (excrement) out the entrance hole.

The stem area near the entrance hole(s) will feel mushy.

Plant's runner or entire vine wilts quickly from larval feeding within stem.

Photo credit E.C.Burkness Univ of MN

Adult Squash Vine Borer

Other Vegetable Problems - Pests

Squash Vine Borer - Management

- To prevent egg-laying, wrap a collar of aluminum foil around lower stems
- Cover plants with floating row cover or insect netting until flowering.
- For active borers, make a vertical slit upward from where frass is observed. Cut half-way through the stem. Remove and kill borer. Mound soil over the wound to induce supplemental rooting.

Photo credit J. Hahn Univ of MN

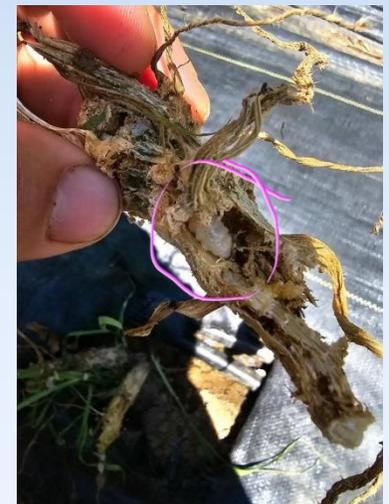

Photo Credit D. Emelio

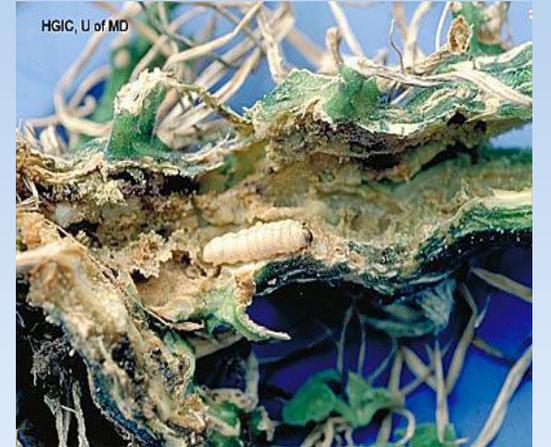

Other Vegetable Problems - Pests

Squash Vine Borer - Management

Spray lower plants stems and base of plant with pyrethrins when adults are flying (mid-late May), or sprinkle diatomaceous earth on lower stems.

Bt (*Bacillus thuringiensis*) or beneficial nematode (*Stinernema carpocapsae*) can be injected into wound to kill borers.

Seal up infested vines in plastic bag before larvae pupate (break life cycle.)

Other Vegetable Problems - Pests

Cucumber Beetles

Spotted Cucumber
beetle

- Major pest of all cucurbits. Spreads bacterial wilt disease to cucumber and muskmelon and, to a lesser extent, summer squash.
- Adults survive the winter in weeds and plant residues. ; 2-3 generations per year
- Feed on all plant parts
- Attracted to bitter compounds, cucurbitacins, which they absorb
- Orange-yellow eggs laid at base of host plants or under soil

Striped Cucumber
beetle

Other Vegetable Problems - Pests

Cucumber Beetles Control

Prevention and early control are essential. In fall, remove garden debris (overwintering sites). In fall or spring, it can be helpful to lightly till soil to kill eggs and larvae.

Use row covers over susceptible plants until they bloom.

Spray with pyrethrum or neem products when seedlings emerge or transplants are planted.

Avoid this pest by planting susceptible crops around June 15, after overwintering adults have emerged and dispersed elsewhere.

Other Vegetable Problems - Pests

Flea Beetles

Host Plants -Eggplant, corn, and cabbage family (i.e. cabbage, broccoli, and cauliflower) are very susceptible, but flea beetles feed on almost every other vegetable to some degree

- Adult feeding riddles leaves with small feeding holes that create a shot-hole effect.
- When foliage is disturbed, tiny beetles jump off in all directions.
- Larvae feeding on roots can lower yields. Adults can transmit viral or bacterial diseases.

Other Vegetable Problems - Pests

Flea Beetles

Common Vegetable Problems, Diseases

Blossom End Rot

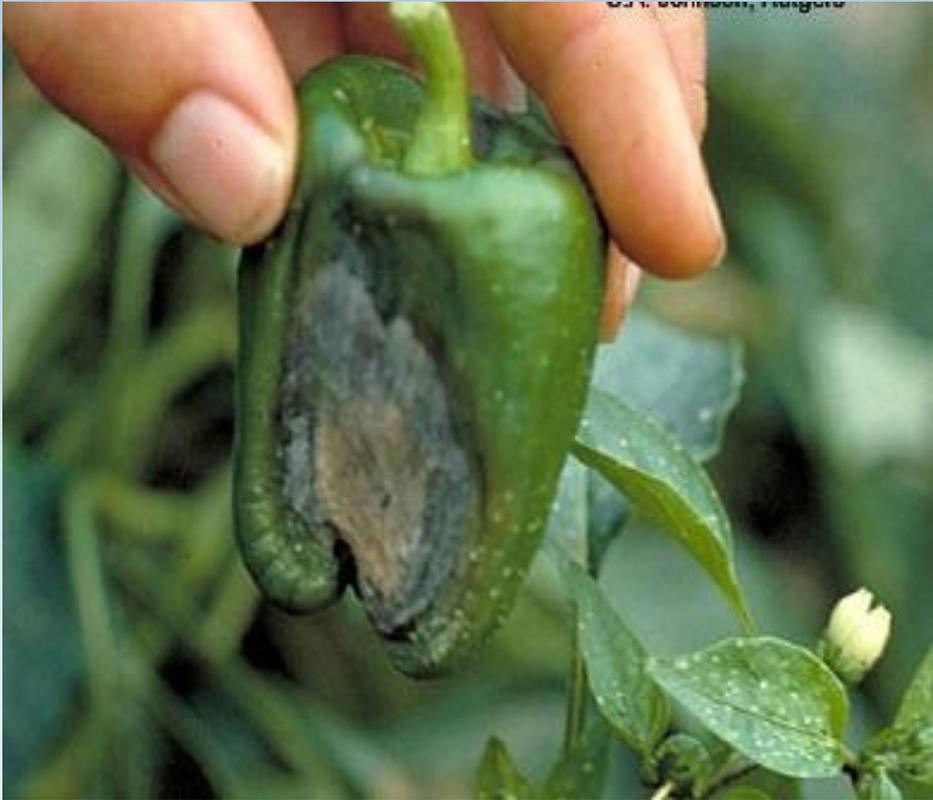

Symptoms:

- dark, leathery, sunken areas on the blossom end of the vegetable, most prevalent on enlarging fruit.
- Caused by a lack of calcium in cell walls due to environmental stress such as inconsistent or shallow watering and drought conditions.

Common Vegetable Problems, Diseases

Blossom End Rot

Management:

- Remove and discard affected fruit.
- Keep plants well-watered and mulched.
- Add Dolomitic Lime or Gypsum (depending on your Garden pH) to help plants take up Calcium.

Common Vegetable Problems, Diseases

Anthracnose

Symptoms:

- Sunken, dark spots caused by fungal disease.
- Affected crops include pepper, bean, tomato, eggplant, cucumber, watermelon, pumpkin, spinach, and peas.
- The fungus overwinters in seeds, soil, and plant residue.

Common Vegetable Problems, Diseases

Anthracnose

Management:

- Add a layer of mulch under plants to stop soil splashing on plants.
- Avoid overhead watering during humid, cloudy weather.
- Use a fungicide spray.
- Remove all plant residue at the end of the growing season.

Cucumber Problems

Downy Mildew

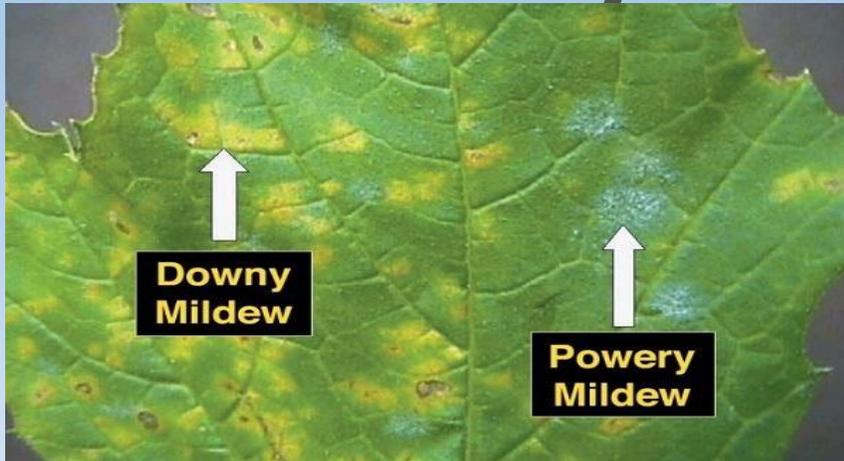

Symptoms:

- Yellow or tan angular spots between the leaf veins are visible on upper surface of older leaves in early-late summer.
- The undersides of the leaves have fuzzy gray spots.
- Downy mildew is caused by water mold (fungus-like) pathogen.
- Moisture, high humidity and cool temperatures (60F) favor development of this disease.

Cucumber Problems

Downy Mildew on Cucumbers

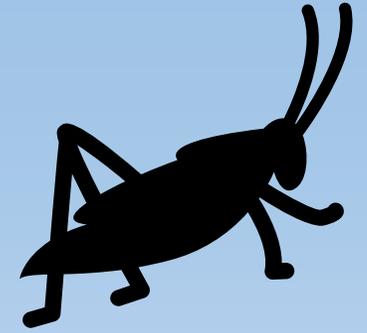

Management

- Spray a fungicide as soon as symptoms are spotted.
- Remove infected plants and place in trash.

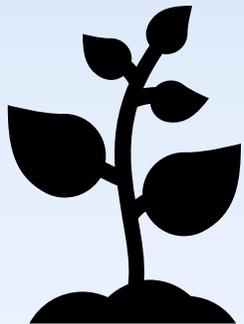

An Overall Strategy – IPM Integrated Pest Management

Some effective organic insecticides

- Pyrethrins- controls or suppresses a wide range of insects
- Neem extract - suppresses beetles and caterpillars
- Neem oil- insecticide and preventative fungicide
- Spinosad- controls beetles, caterpillars, flies, thrips
- Bacillus thuringiensis (Bt)- controls young caterpillars; suppresses large caterpillars
- Horticultural oil- controls aphids, mites, soft-bodied immatures
- Insecticidal soap- suppresses aphids, mites, soft-bodied immatures
- Surround (kaolin clay)- suppresses and deters insect pests
